Abstract: This liaison statement is to inform ITU-R Study Group 6 and ITU-T Study Group 16 about the initiation by ITU-T SG9 of the new work item on the draft ITU-T Technical Report TR.WiFiTV “Secondary distribution of digital television and audiovisual content to portable devices using Wi-Fi”.

ITU-T Study Group 9 would like to inform ITU-R Study Group 6 and ITU-T Study Group 16 about the initiation of the new work item on the draft ITU-T Technical Report TR.WiFiTV “*Secondary distribution of digital television and audiovisual content to portable devices using Wi-Fi*”.

The Technical Report will address aspects related to delivering television and other audiovisual signals to smartphones and other portable devices using Wi-Fi constituting the last mile of secondary distribution TV network. In other words, the scope of the draft Technical Report is intended to cover the last mile connection via Wi-Fi interconnected with the conventional TV transmission modes of satellite, cable, or terrestrial.

SG9 is going to develop this Technical Report from the view point of integrated broadband cable television technology and also would like to refer to or collect other necessary information by collaborating with relevant Study Groups or SDOs. While the proposed Technical Report would cover the network architecture, transcoding requirements, other technical requirements, mechanism to facilitate local content distribution, local advertisement insertion, logging end user statistics, case studies, and more, the Technical Report would not cover the radio communication broadcasting.

The objective of the Technical Report is to collect information that may drive future standardization to enhance the use of widely available Wi-Fi networks and Wireless LAN networks for the last mile

delivery of linear television and audiovisual content to portable devices in a manner that is cost-effective for the end users and does not load the mobile networks.

ITU-T Study Group 9 would like to exchange comments on this topic with ITU-R SG6 and ITU-T SG16.
