Abstract: This contribution contains the proposed A.13 justification for initiating a new work item on draft new ITU-T document J.FSR-TEST "Factual subscriber-base reporting and protected content delivery in Conditional Access System – Test Methods". This new work item is being submitted as supplement of the implementation of ITU-T recommendation J.FSR-REQ "Factual subscriber-base reporting and protected content delivery in conditional access system – Requirements". The ITU-T recommendation J.FSR-REQ is ongoing work items and in final stage. The RGM(230210) output document [SG9-TD287/GEN (2023-02)] mentions for its approval in the coming SG9 meeting.**Proposal:** The proposed A.13 justification is placed as Annex-1. The proposed baseline text is annexed with another contribution and it provides suggestive clauses for this proposed new draft ITU-T document "Factual subscriber-base reporting and protected content delivery in Conditional Access System – Test Methods"

Annex 1

A.13 justification for initiating new work item on draft new ITU-T document J.FSR-TEST "Factual subscriber-base reporting and protected content delivery in Conditional Access System – Test Methods"

Question:	Q2/9	Proposed new ITU-T Recommendation	Bangalore, 09-18 May 2023
Reference and title:	draft ITU-T document J.FSR-TEST "Factual subscriber-base reporting and protected content delivery in Conditional Access System – Test Methods"		
Base text:	SG09-C-xxx	Timing:	2023-08
Editor(s):	Avinash Agarwal, Ministry of Communications, India avinash.70@gov.in Harsh Sharma, Ministry of Communications, India dircb2.tec-dot@gov.in	Approval process:	Agreement
Scope (defines the intent or object of the Recommendation and the aspects covered, thereby indicating the limits of its applicability): The proposed draft new document will provide the clause-by-clause test procedures and expected results for each clause of the draft new ITU-T Recommendation J.FSR-REQ such as log requirements, reports requirements, database requirements, security requirements, and more. By applying these test procedures on CAS, two major concerns, 'underreporting of subscribers' and 'content piracy', leading to revenue loss to broadcasters, content providers and the governments', can easily be ascertained. Functional requirements of Conditional Access Systems (CAS) are mentioned in the ongoing work item ITU-T Recommendation J.FSR-REQ "Factual subscriber-base reporting and protected content delivery in conditional access system – Requirements" and are in final stage. RGM(230210) output document J.FSR-REQ [SG9-TD287/GEN (2023-02)] may be referred.			
Summary (provides a brief overview of the purpose and contents of the Recommendation, thus permitting readers to judge its usefulness for their work): Conditional Access System (CAS) having sub-standard solutions can be prone to manipulations and vulnerable to hacking, leading to loss of revenue to the concerned broadcasters and the government. Therefore, it is necessary to use tested and certified CAS systems to ensure factual reporting of subscriber-base and protected delivery of content to authorised subscribers. The purpose of this document is to frame the testing methodology against the various technical requirement of CAS. In addition to develop a framework for standardization (i.e. Technical Requirements), some countries have issued the provisions for assuring broadcasters and content providers that each CAS system has to conform to certain technical features and get tested from certified lab before deployment so that piracy and other malpractices can be minimised. Question 2/9 broadly deals with the technical specifications of CAS. Therefore, this contribution proposes for initiation of a new work item to frame test methods against the various requirement as mentioned in the ongoing work item J.FSR-REQ "Factual subscriber-base reporting and protected			

content delivery in conditional access system – Requirements". The proposed baseline text annexed with another contribution provides suggestive clauses for this new document.
Relations to ITU-T Recommendations or to other standards (approved or under development): [ITU-T J.93], [ITU-T J.95] These are very old ITU-T recommendations and their scope does not include the functional requirements for the purpose mentioned above. [ITU-R BT.1852-1] This ITU-R Recommendation covers the technical aspects of scrambling and access control but does not include the functional requirements to prevent malpractices and manipulations mentioned above. [ITU-T SG9-TD287/GEN (2023-02)] Ongoing work item ITU-T Recommendation J.FSR-REQ "Factual subscriber-base reporting and protected content delivery in conditional access system – Requirements". Draft ITU-T Technical Report J.TR.FSR "Technical report on factual subscriber-base reporting and protected content delivery in conditional access system (CAS)"
Liaisons with other study groups or with other standards bodies: None
